

Semantics of two-dimensional type theory

Benedikt Ahrens Paige Randall North **Niels van der Weide**

May 20, 2022

2-Dimensional interpretations of type theory

There are many interpretations of type theory that are 2-dimensional in a certain sense

- ▶ The groupoid interpretation by Hofmann and Streicher¹
- ▶ The two-dimensional models by Garner²

Interpreted in something like **groupoids**

¹Hofmann, Martin, and Thomas Streicher. "The groupoid interpretation of type theory." *Twenty-five years of constructive type theory (Venice, 1995)* 36 (1998): 83-111.

²Garner, Richard. "Two-dimensional models of type theory." *Mathematical structures in computer science* 19.4 (2009): 687-736.

Directed type theory

But directed variants have also been considered

- ▶ An interpretation with directed definitional equality³
- ▶ A syntactical framework for directed type theory⁴
- ▶ An interpretation with directed identity types⁵

Interpreted in something like **categories**

³Licata, Daniel R., and Robert Harper. "2-dimensional directed type theory." *Electronic Notes in Theoretical Computer Science* 276 (2011): 263-289.

⁴Nuyts, Andreas. Towards a directed homotopy type theory based on 4 kinds of variance. Master's thesis, KU Leuven, 2015.

⁵North, Paige Randall. "Towards a directed homotopy type theory." *Electronic Notes in Theoretical Computer Science* 347 (2019): 223-239.

A framework is missing

Problem:

- ▶ Garner gave a general notion of 2-dimensional comprehension category, but this only works for **undirected** type theory
- ▶ The interpretations of directed type theory are ad hoc

Goal of this talk:

find categorical framework in which one can interpret various flavors of 2-dimensional type theory

The work in this talk has been formalized using UniMath.

Idea

- ▶ Use bicategories instead of categories
- ▶ Define **comprehension bicategories**.
- ▶ For that, we need a bicategorical notion of fibration
- ▶ We use ingredients by Hermida⁶ and by Buckley⁷
- ▶ Find suitable instances of comprehension bicategories

⁶Hermida, Claudio. "Some properties of Fib as a fibred 2-category." *Journal of Pure and Applied Algebra* 134.1 (1999): 83-109.

⁷Buckley, Mitchell. "Fibred 2-categories and bicategories." *Journal of Pure and Applied Algebra* 218.6 (2014): 1034-1074.

Comprehension categories

Type theory can be interpreted in **comprehension categories**.

Definition

A **comprehension category** is a *strictly* commuting triangle

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\chi} & \mathcal{C}^{\rightarrow} \\ & \searrow F & \swarrow \text{cod} \\ & \mathcal{C} & \end{array}$$

where F is a Grothendieck fibration and where χ preserves cartesian cells.

Fibrations of bicategories

- ▶ The notion of fibration of bicategories has a **global** condition and **local** condition.

Fibrations of bicategories

- ▶ The notion of fibration of bicategories has a **global** condition and **local** condition.
- ▶ For both the global condition, we need an appropriate notion of cartesian 1-cells.
- ▶ For both the local condition, we need an appropriate notion of cartesian 2-cells.

Fibrations of bicategories

- ▶ The notion of fibration of bicategories has a **global** condition and **local** condition.
- ▶ For both the global condition, we need an appropriate notion of cartesian 1-cells.
- ▶ For both the local condition, we need an appropriate notion of cartesian 2-cells.
- ▶ We also require that cartesian 2-cells are closed under horizontal composition.

The global condition

A pseudofunctor satisfying the global condition is called a **global fibration**.

The global condition basically says the following: given

- ▶ contexts Γ_1 and Γ_2
- ▶ a substitution $s : \Gamma_1 \rightarrow \Gamma_2$
- ▶ a type A in context Γ_2

we get a type $A[s]$ in context Γ_1 .

The local condition

We think of 2-cells $\tau : s_1 \Rightarrow s_2$ as reductions from s_1 to s_2

A pseudofunctor satisfying the local condition is called a **local opfibration**.

The local condition

We think of 2-cells $\tau : s_1 \Rightarrow s_2$ as reductions from s_1 to s_2

A pseudofunctor satisfying the local condition is called a **local opfibration**.

Local condition: given

- ▶ contexts Γ_1, Γ_2
- ▶ substitutions $s_1, s_2 : \Gamma_1 \rightarrow \Gamma_2$
- ▶ a reduction $\tau : s_1 \Rightarrow s_2$
- ▶ a type A in context Γ_2
- ▶ a term t of type $A[s_1]$

we get a a term of type $A[s_2]$.

Comprehension bicategories

A **comprehension bicategory** is a *strictly* commuting triangle

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\chi} & \mathcal{B}^{\rightarrow} \\ & \searrow F & \swarrow \text{cod} \\ & \mathcal{B} & \end{array}$$

where χ preserves cartesian cells and where F is a global fibration and a local opfibration.

Examples of comprehension bicategories

Given a **locally groupoidal** bicategory \mathcal{B} with pullbacks, take

$$\begin{array}{ccc} \mathcal{B}^{\rightarrow} & \xrightarrow{\text{id}} & \mathcal{B}^{\rightarrow} \\ & \searrow \text{cod} \quad \swarrow \text{cod} & \\ & \mathcal{B} & \end{array}$$

⁸Garner, Richard. "Two-dimensional models of type theory." *Mathematical structures in computer science* 19.4 (2009): 687-736.

Examples of comprehension bicategories

Given a **locally groupoidal** bicategory \mathcal{B} with pullbacks, take

$$\begin{array}{ccc} \mathcal{B}^{\rightarrow} & \xrightarrow{\text{id}} & \mathcal{B}^{\rightarrow} \\ & \searrow \text{cod} \quad \swarrow \text{cod} & \\ & \mathcal{B} & \end{array}$$

This resembles the models by Garner⁸

⁸Garner, Richard. "Two-dimensional models of type theory." *Mathematical structures in computer science* 19.4 (2009): 687-736.

Examples of comprehension bicategories

Given a **locally groupoidal** bicategory \mathcal{B} with pullbacks, take

$$\begin{array}{ccc} \mathcal{B}^{\rightarrow} & \xrightarrow{\text{id}} & \mathcal{B}^{\rightarrow} \\ & \searrow \text{cod} \quad \swarrow \text{cod} & \\ & \mathcal{B} & \end{array}$$

This resembles the models by Garner⁸

This does **not** work for arbitrary bicategories.

⁸Garner, Richard. "Two-dimensional models of type theory." *Mathematical structures in computer science* 19.4 (2009): 687-736.

Examples of comprehension bicategories

The work by North⁹ and by Licata and Harper¹⁰ is encapsulated in the following comprehension bicategory

$$\begin{array}{ccc} \underline{\text{Cat}} / \text{Cat} & \xrightarrow{\quad} & \underline{\text{Cat}}^{\rightarrow} \\ & \searrow \text{dom} \quad \swarrow \text{cod} & \\ & \underline{\text{Cat}} & \end{array}$$

Here:

- ▶ Cat is the bicategory of categories
- ▶ Cat is the category of categories

⁹North, Paige Randall. "Towards a directed homotopy type theory." *Electronic Notes in Theoretical Computer Science* 347 (2019): 223-239.

¹⁰Licata, Daniel R., and Robert Harper. "2-dimensional directed type theory." *Electronic Notes in Theoretical Computer Science* 276 (2011): 263-289.

Examples of comprehension bicategories

We have the following comprehension bicategory

Categorification of the previous one

Examples of comprehension bicategories

Given a bicategory \mathcal{B} with pullbacks, take

$$\begin{array}{ccc} \mathrm{SOpFib}(\mathcal{B}) & \xrightarrow{\quad} & \mathcal{B}^{\rightarrow} \\ & \searrow \mathrm{cod} & \swarrow \mathrm{cod} \\ & \mathcal{B} & \end{array}$$

Here $\mathrm{SOpFib}(\mathcal{B})$ is the bicategory of Street opfibrations in \mathcal{B} .
Directed version of Garner's stuff.

Remark on the formalization

- ▶ The notion of comprehension bicategory and fibration have been formalized using UniMath.
- ▶ Here we make use of **displayed bicategories**¹¹

¹¹Ahrens, B., et al (2022). Bicategories in univalent foundations. *Mathematical Structures in Computer Science*, 1-38.

Conclusion

- ▶ We defined a notion of **comprehension bicategory**
- ▶ This is a suitable framework in which one can interpret (directed) type theory: we proved **soundness**
- ▶ There are general instances of this definition (internal Street fibrations)

Further work: look at type formers, completeness
